TECHNICAL SKILLS

Node.js, Express, JavaScript, jQuery, Github, MySQL, Firebase, HTML, CSS, Bootstrap, Media Queries, APIs, JSON, REST, AJAX, Handlebars, Express, MongoDB and React.

PROJECTS

Moodie (Carlsbad, CA)

Full Stack Developer

- Moodie is a full stack web application built using Node, Express, Handlebars and mySQL using MVC. Moodie uses Face ++ API facial recognition software to analyze photos and display results based on the user's facial expressions. Moodie evaluates 7 different micro expressions: Happiness, Sadness, Disgust, Anger, Fear, Neutral and Surprise.
- The web application accesses the user's webcam and/or camera phone to let the user take photos of themselves. Moodie will choose a random emotion and the user must try and take a photo of themselves making that expression. The user will get results instantly letting them know how closely they matched the chosen expression.
- Myself and another were responsible for the front-end portion of the project.

Friend Finder (Carlsbad, CA)

Full Stack Developer

- A web app that has users take a short ten questions survey and then compares their answers with other users and gives them a match based on closeness of answers.
- I coded the entire app using HTML, CSS, Node, Javascript, jQuery and Bootstrap.
- <https://github.com/klaytonolavi/FriendFinder>

Bamazon (Carlsbad, CA)

Full Stack Developer

- A back-end application that uses the terminal to let users search through an inventory of items, choose an item and a quantity to purchase and then shows them the total price and updates the inventory in real time.
- This application uses Node.js and MySQL.
- <https://github.com/klaytonolavi/Bamazon>

Liri-Bot (Carlsbad, CA)

Full Stack Developer

- Liri-Bot is a back-end application that lets users control a bot through terminal commands to do a few different functions. Liri-Bot can retrieve the last 20 of my Tweets from Twitter, give me Spotify results for songs that I search and will give me OMDb movie ratings and information for any movies that are searched.
- This application uses Node.js, Moment.js, AJAX and multiple API calls.
- <https://github.com/klaytonolavi/liri-bot>

Burger (Carlsbad, CA)

- Burger is a simple back-end node application that allows users to enter their own types of burgers then choose which burgers they would like to eat. When a user adds their own burger, the burger gets added to a list with a button that lets the user “devour” the burger, which sends the burger to a “devoured” list.
- This application uses MySQL to store the burger data so the page is persistent and saves the burgers even after page close or refresh.
- This application uses Node.js, Express, Handlebars, MySQL and is set up with an MVC structure.
- <https://github.com/klaytonolavi/Burger>

ADDITIONAL EXPERIENCE
